OUTCOME MEASURES

Each year, the success of Rose Hill Center's treatment program can be seen in the lives of the residents who return to their families and communities. We have verified this through outcomes measures and assessments which have consistently shown an improvement in our residents' functioning and a decrease in psychiatric symptoms. Rose Hill utilizes the Daily Living Activities-20 (DLA-20), a research-based outcomes measurement tool which measures twenty items of functionality. The DLA-20 is measured at admission, quarterly, during transfer to another Rose Hill program level, and at discharge. In 2015, the DLA-20 scores of residents who successfully graduated from one of our Residential Programs averaged an increase of 14%-33%. Those who also participated in the Transitional Living Program averaged a 79% improvement.
